Peer review variables

My partner Gregg was really specific in the way he named his variables and I was more minimalistic so to say. We then discussed how we could name variables properly. We agreed that the names shouldn't be too long, but specific enough that another person could read the code comfortably.

We also managed to get the error solved that appeared when typing in input as a double, but using the international form of "12.5" instead of the more european way of "12,5". We changed our systems region to US.

Since Gregg likes to type a lot of comments in his code, he figured out that /* lets you comment on multiple lines. He also showed me how you can round a double up instead of down with an integer.

I now have a better understanding when and why I should use Int or Double.
