Peer review t3

Due to sickness our group decided to review our code altogether in a group of three.

The output of our code was the same, as were our approaches. I prefer to just print the functions as a whole and also now tend to use more nesting than Greg and Mehmet, but we decided that that is only a matter of preference and style and isn't affecting our code.

```java
public static String makeLastCapital(String drinkName) {
    return drinkName.toLowerCase().substring(0, drinkName.length()
 - 1)
            + drinkName.toUpperCase().substring(drinkName.length()
 - 1);
```

We are also not sure how the code could be improved in a meaningful way. We surely could make it shorter, but then the readability would suffer.

We are looking forward to the upcoming weeks and new challenges that will allow for more solutions and teach different approaches to different problems.

I learned that the add functions can be used without a position index, or with an index. If you want to remove something from the end of a list/string use: the size/length function -1

```java
dirtyDishes.get(dirtyDishes.size() - 1)
```

The start is 0
